

Benign shocks ??
(THIS IS THE LUCK WE NEED)

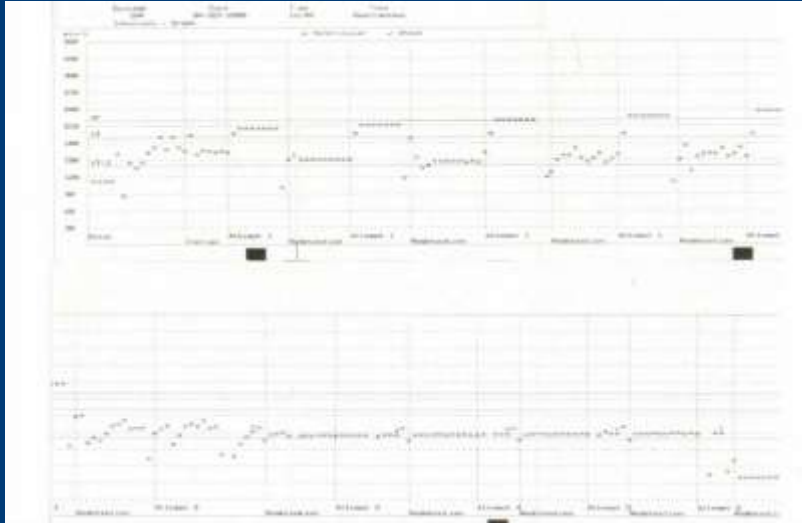

Mohammad H. Khedr

MD Cardiology, Zagazig University
EP fellowship, McMaster University

Case

- 74Y Male admitted to the Hospital after receiving one shock
- **He has past medical history of**
 - ICM EF 29%
- Single chamber GUIDANT ICD IN 2005 for secondary prevention
- Had previous history of VT and shocks.
- DM, HTN

Summary Of The Events

Interrogation Of The Device

The 2nd and 3rd attempt

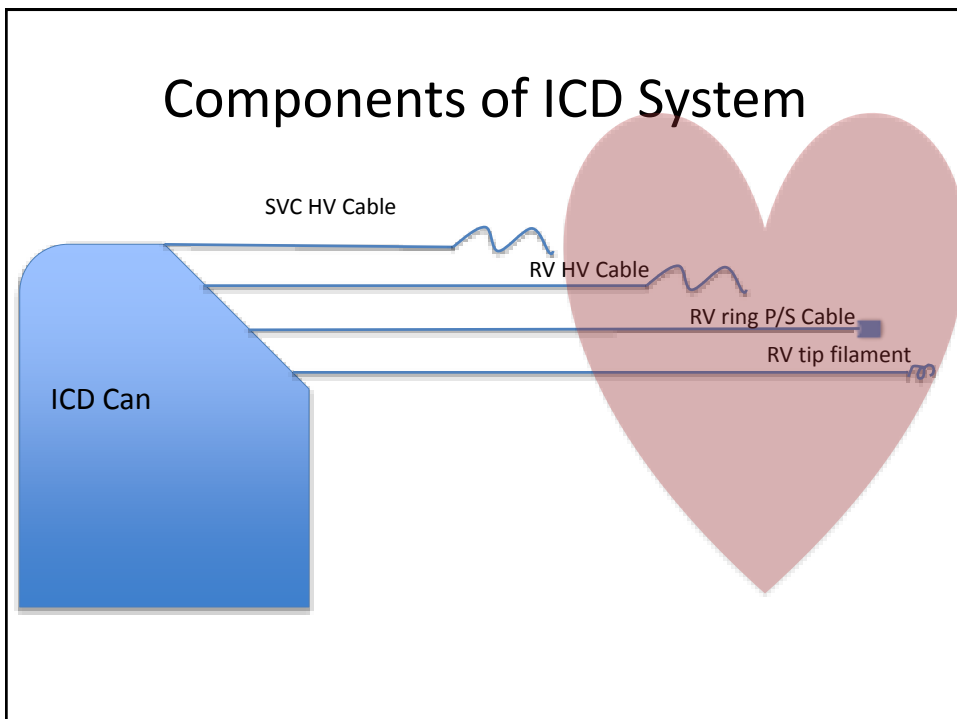

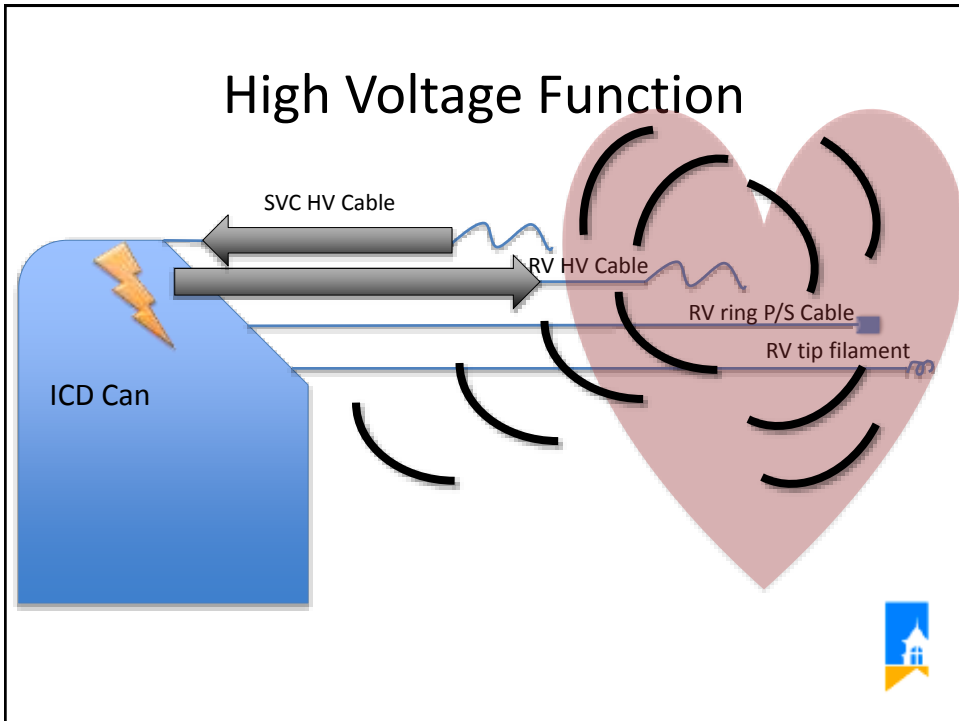

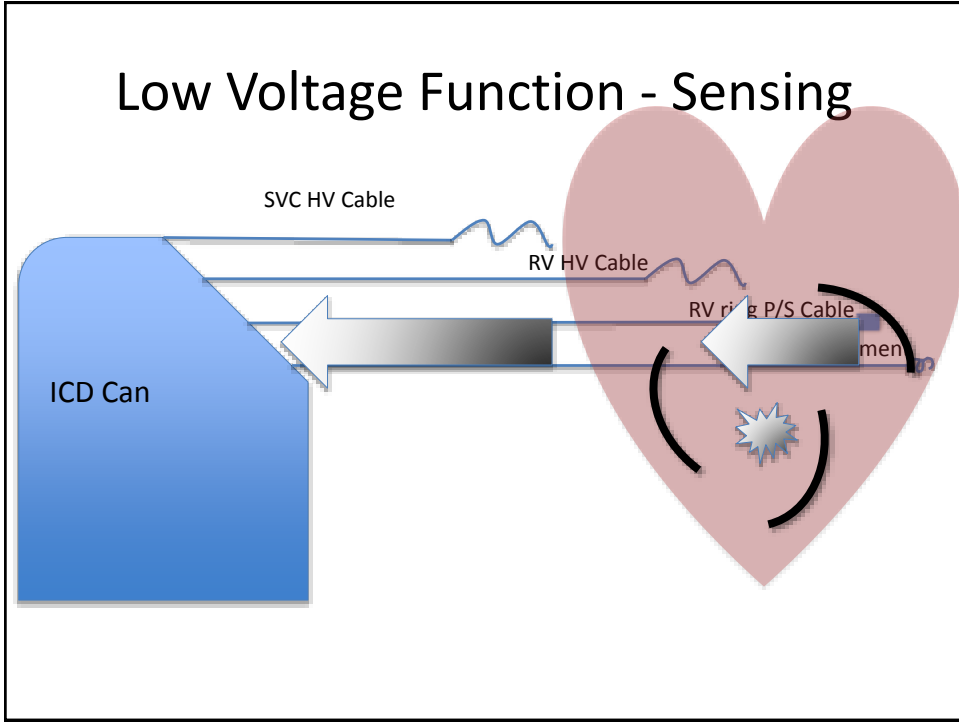

The 6th attempt succeed to terminate the attack

HOW TO EXPLAIN?

- So the patient felt **one** shock although there is **five** shocks recorded. four of them failed to terminate the episode of VT1.

High Voltage Failure is Tough to Detect

- Impedance is only measured parameter
 - No sensing/noise alerts, no pacing threshold
- Testing amplitude is order of magnitude less than working stress on lead
- Failure may be **asymptomatic** and go **undetected** for years
- **First presentation may be sudden cardiac arrest or death**
 - High voltage failure is “quiet”
 - May go undiagnosed if no postmortem interrogation

How does HV Failure Present?

- Silent failure, picked up with remote notification

SVC Defibr Impedance
Last Measured 62 ohms

How does HV Failure Present?

- Silent failure, picked up with remote notification
- Silent failure, picked up in office

How does HV Failure Present?

- Silent failure, picked up with remote notification
- Silent failure, picked up in office
- Silent failure, seen w/hospital shock testing

EDITORIAL COMMENT

Defibrillation Threshold

Testin **“annual DFT testing, once a common clinical practice is performed infrequently today”**

Anne B. Curtis, MD, FACC
Tampa, Florida

JACC Aug 2008

The established reliability of current ICD systems has led most electrophysiologists to abandon the practice of routine DFT testing before hospital discharge. Even annual DFT

How does HV Failure Present?

- Silent failure, picked up with remote notification
- Silent failure, picked up in office
- Silent failure, picked up w/hospital HV testing
- **Clinical Shock with manifest failure**
 - Inappropriate

How does HV Failure Present?

How Do We Detect HV Component Failure?

- What can fail?
 - Pulse Generator

How Do We Detect HV Component Failure?

- What can fail?
 - Pulse Generator
 - Generator/Lead Interface – i.e. header

Second Update of FDA Preliminary Public Health Notification*:
Guidant VENTAK PRISM® 2 DR and CONTAK RENEWAL® Implantable
Cardioverter Defibrillators

This is an archived document and is no longer current information.
December 28, 2005

How Do We Detect HV Component Failure?

- What can fail?
 - Pulse Generator
 - Generator/Lead Interface – i.e. header
 - Lead
 - Weakest Link in the Chain
 - Types of Failures
 - **Conductor**
 - **Insulator**

Response to Failed Shock

Conductor Failure – High impedance

- Cable fracture, Set screw issue
 - Fidelis
- Current delivery attenuated to affected limb of circuit
 - RV coil → likely ineffective shock
 - SVC coil → likely effective shock *unless high DFT*
- Device will be unharmed and report out a high impedance alert

Response to Failed Shock

Insulator Failure – Low impedance

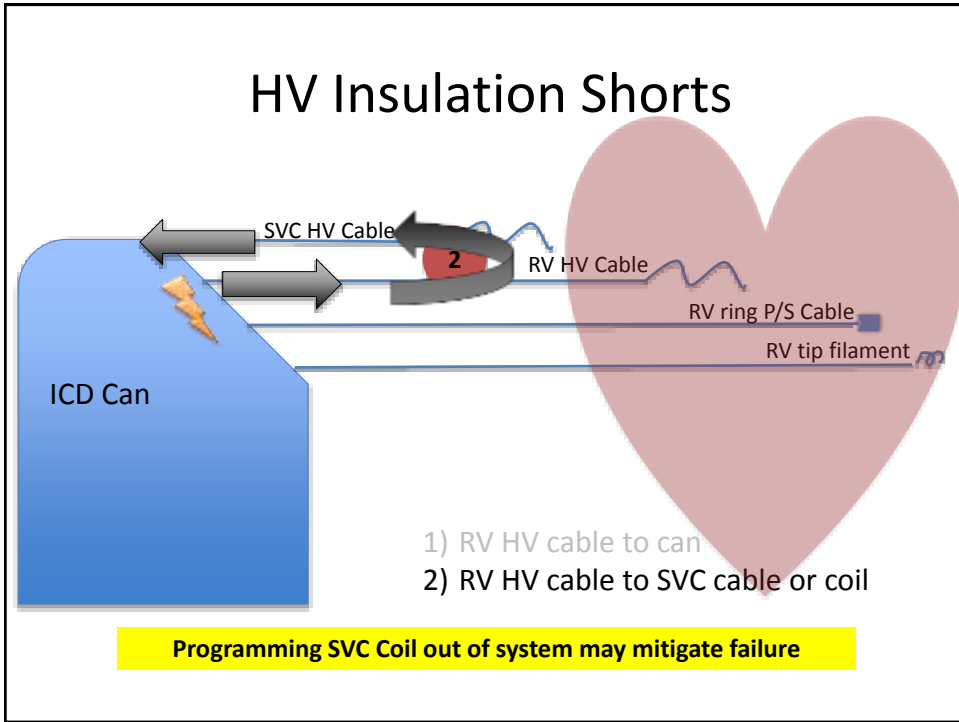

- **Abrasion:** *can/coil* , *coil/coil*, **Header short**
 - Riata, PRIZM 2 DR
- HV Current → pulse generator as a short
 - **Older devices:** current shunted from heart , electrical overstress may damage PG
 - **Newer devices:** current shunted, PG protected.
- If PG is still intact, low Ω alert issued.
- St. Jude *Dynamic Tx*
 - Reconfigures shock to remove SVC coil or can from circuit if breach detected.

HV Insulation Shorts

Programming the can out of the system may mitigate (if dual coil lead)

Is High-Voltage Lead Integrity Measurement Adequate During Defibrillator Generator Replacement?

^{1,2,3}RAHUL DOSHI, MD, FHRS, ¹STEVEN CEBALLOS, CVT and ¹FAUSTO MENDEZ, CVT

Short evident between SVC coil and RV shock cable

Medtronic

Shock Lead Impedance Testing

- Pulse delivered daily (up to 4 attempts)
 - 400 mV for 90 msec
- Two vectors reported
 - HV Impedance = RV coil to SVC coil+Can
 - SVC Impedance = RV coil to SVC coil
- Alarm for Impedance < 20Ω, > 200Ω (programmable)
- Triggers clinician and patient alert (not LIA)

ST. JUDE
MEDICAL

Shock Lead Impedance Testing

- Atlas/Epic have no daily measurements •
- Physician generated HVLI test (12v) •
- Later Generations HV pulse delivered daily •
- All vectors (RV and SVC to can) –
- Alert impedances are programmable •

Evidence Base for Shock Lead Integrity Testing

Subthreshold Test Pulses Versus Low Energy Shock Delivery to Estimate High Energy Lead Impedance in Implanted Cardioverter Defibrillator Patients

DIRK VOLLMANN¹, LARS LUETHJE¹,
DIETER ZENKER², SEBASTIAN DOMHOF³
and CHRISTINA UNTERBERG¹

Article first published online: 28 MAR 2003

Issue

Pacing and Clinical
Electrophysiology
Volume 26, Issue 1p2, pages
457-460, January 2003

Validation of newly developed HV testing technique
29 pts with Guidant PRIZM ICDs at implant
 All pts got 0.4 μ J pulse, 1.1 J, and 16-45 J shocks
 Impedances measured for all pulse strengths
Low energy pulses correlated with high energy shocks

Evidence Base for Shock Lead Integrity Testing

"Partial insulation defects may not be identified by low-energy pulses that deliver insufficient current to activate the shorted high-output protection feature."

Swerdlow/Friedman Pacing Clin Electrophysiol. 2006;29(1):70-96.

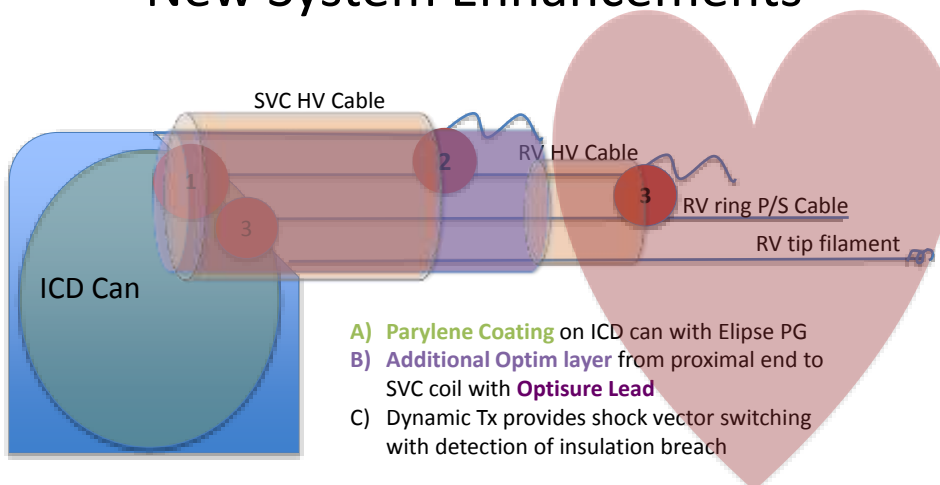

When Failure means life

Airbag Reliability

- 100 drivers
 - 10 get in accident
 - 9 effective airbag deployment
 - 1 driver dies with ineffective airbag
- What is the airbag failure rate?
 - 1% or 10%?

New System Enhancements

HV Component Failure by Lead Model

- Evolution to cable design associated with improved lead performance

Follow Up Considerations - Summary

- Programming
 - Set an unused EGM channel to RV Coil to SVC Coil (not a nominal setting) to monitor for noise
 - Turn on EGM for Noise Reversion (nominally off)
 - Options to set HVLI alert to tighter range (15 ohms outside established range)
 - Increase the number of VF intervals and VF Detection Rate based on the specific patient
- Diagnostic inspection
 - Look for counts in high rate bins (>240 bpm)
 - Check presenting rhythm / EGMs for noise or deviations on vectors that include RV Coil, SVC Coil, RV Ring
 - Check HVLI on all vectors for variation of > 25% since last follow-up
 - Examine real time electrogram on pacing and shocking components

High Voltage ICD Lead Failure Summary

- Underappreciated and potentially fatal
- Can present with no change in painless HV impedance or any other parameters measured in ICD follow up
- Presentation varied and at times very complex
- Existing means of detection are inadequate
- **Do we need to change our follow up strategies?**

Thank You
